

ABSTRACT

A method of forming and connecting an antenna to a feedthrough member of a housing. The method comprising a step of: positioning the feedthrough member and an antenna template relative to each other. A step of connecting the first portion of at least one electrically conducting wire to the feedthrough member. An additional step  
5 of winding the wire at least once around the antenna template, and a further step of connecting a second portion of each wire to said feedthrough member.
